Results appear in the order in which they were run. Bold underlined text indicates a median measurement.

Operating System Notes

```
Processes were bound to cores using "submit" and "pbind".

These shell commands request use of 4MB pages:
      export LD_PRELOAD=mpss.so.1
      export MPSSHEAP=4MB
      export MPSSSTACK=4MB

ulimit -s 131072 was used to limit the space
consumed by the stack (and therefore make more
space available to the heap).

The "webconsole" service was turned off using
    svcadm disable webconsole
```

Platform Notes

```
"CPUM" = CPU Module; each module holds two CPU chips.

Memory is 8-way interleaved by filling all slots with
the same capacity DIMMs.

This result was measured using a Sun SPARC Enterprise
M4000 Server.  Note that the Fujitsu SPARC Enterprise
M4000 and Sun SPARC Enterprise M4000 are electrically
equivalent.
